

6

Using Subqueries to Solve Queries

Using a Subquery to Solve a Problem

Who has a salary greater than Abel's?

Main query:

Which employees have salaries greater than Abel's salary?

Subquery:

What is Abel's salary?

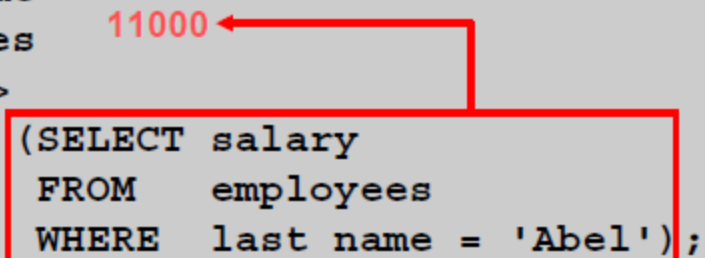

Subquery Syntax

```
SELECT  select_list
FROM    table
WHERE   expr operator
        (SELECT      select_list
         FROM        table);
```

- The subquery (inner query) executes once before the main query (outer query).
- The result of the subquery is used by the main query.

Using a Subquery

```
SELECT last_name  
FROM employees  
WHERE salary >  
      (SELECT salary  
       FROM employees  
       WHERE last name = 'Abel');
```

LAST_NAME
King
Kochhar
De Haan
Hartstein
Higgins

Types of Subqueries

- Single-row subquery

- Multiple-row subquery

Single-Row Subqueries

- Return only one row
- Use single-row comparison operators

Operator	Meaning
=	Equal to
>	Greater than
>=	Greater than or equal to
<	Less than
<=	Less than or equal to
<>	Not equal to

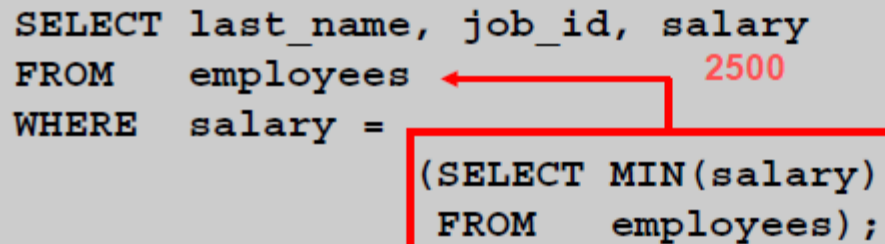

Executing Single-Row Subqueries

```
SELECT last_name, job_id, salary
FROM employees
WHERE job_id =  ST_CLERK
AND salary > 
  (SELECT job_id
   FROM employees
   WHERE employee_id = 141)
  (SELECT salary
   FROM employees
   WHERE employee id = 143);
```

LAST_NAME	JOB_ID	SALARY
Rajs	ST_CLERK	3500
Davies	ST_CLERK	3100

Using Group Functions in a Subquery

```
SELECT last_name, job_id, salary
FROM employees ← 2500
WHERE salary =
  (SELECT MIN(salary)
   FROM employees);
```

LAST_NAME	JOB_ID	SALARY
Vargas	ST_CLERK	2500

The HAVING Clause with Subqueries

- The Oracle server executes subqueries first.
- The Oracle server returns results into the HAVING clause of the main query.

```
SELECT  department_id, MIN(salary)
FROM    employees
GROUP BY department_id
HAVING  MIN(salary) >  2500
        (SELECT MIN(salary)
         FROM    employees
         WHERE   department_id = 50);
```

Multiple-Row Subqueries

- Return more than one row
- Use multiple-row comparison operators

Operator	Meaning
IN	Equal to any member in the list
ANY	Compare value to each value returned by the subquery
ALL	Compare value to every value returned by the subquery

Using the ANY Operator in Multiple-Row Subqueries

```
SELECT employee_id, last_name, job_id, salary
FROM   employees          9000, 6000, 4200
WHERE  salary < ANY ←
      (SELECT salary
       FROM   employees
       WHERE  job_id = 'IT_PROG')
AND    job_id <> 'IT_PROG';
```

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
124	Mourgos	ST_MAN	5800
141	Rajs	ST_CLERK	3500
142	Dawies	ST_CLERK	3100

Using the ALL Operator in Multiple-Row Subqueries

```
SELECT employee_id, last_name, job_id, salary
FROM   employees          9000, 6000, 4200
WHERE  salary < ALL
      (SELECT salary
       FROM   employees
       WHERE  job_id = 'IT_PROG')
AND    job_id <> 'IT_PROG';
```

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
141	Rajs	ST_CLERK	3500
142	Davies	ST_CLERK	3100
143	Matos	ST_CLERK	2600
144	Vargas	ST_CLERK	2600

Summary

In this lesson, you should have learned how to:

- Identify when a subquery can help solve a question
- Write subqueries when a query is based on unknown values

```
SELECT  select_list
FROM    table
WHERE   expr operator
        (SELECT select_list
         FROM   table);
```
